SUBJECT:

Evaporative Systems Service

MODELS:

1996 - 2005 All Chrysler Group Vehicles

DISCUSSION:

The Evaporative Emissions Systems on today's vehicles are comprised of sophisticated components, all of which must be operational for the system to perform properly. To remain operational all components must be properly maintained and serviced as describe in the appropriate service information available on TechCONNECT.

All worn, damaged, or inoperative evaporative emissions components must be replaced with new, unused components available from DaimlerChrysler.

In addition all evaporative emissions hoses both pre-formed and straight must be replaced in their entirety. Under no circumstances should a worn or damaged hose be repaired. Any attempt to repair a worn or damaged hose may result in a future repeat failure of the same hose, and the customer may experience a repeat condition. Hoses must be replaced with new assemblies when available or approved bulk hose when the assemblies are not available.

The approved service procedure, using new MOPAR service components, is the only way to ensure that a repair of the evaporative emission system will be permanent. This is very important to ensure that the evaporative emission system functions properly for the useful life of the vehicle.
